

Let's consider a linear approximation of the differentiable function f along some direction $h, ||h||_2 = 1$:

Let's consider a linear approximation of the differentiable function f along some direction $h, \|h\|_2 = 1$:

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

Gradient Descent

୬ ମ Ø

Let's consider a linear approximation of the differentiable function f along some direction $h, \|h\|_2 = 1$:

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want \boldsymbol{h} to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

Let's consider a linear approximation of the differentiable function f along some direction $h, \|h\|_2 = 1$:

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want \boldsymbol{h} to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

and going to the limit at $\alpha \to 0$:

$$\langle f'(x), h \rangle \leq 0$$

Let's consider a linear approximation of the differentiable function f along some direction $h, ||h||_2 = 1$:

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want h to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

and going to the limit at $\alpha \to 0$:

$$\langle f'(x), h \rangle \leq 0$$

Also from Cauchy–Bunyakovsky–Schwarz inequality:

$$|\langle f'(x), h \rangle| \le ||f'(x)||_2 ||h||_2$$

 $\langle f'(x), h \rangle \ge -||f'(x)||_2 ||h||_2 = -||f'(x)||_2$

 $f \to \min_{x,y,z}$ Gradient Descent

Let's consider a linear approximation of the differentiable function f along some direction $h, ||h||_2 = 1$:

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want
$$h$$
 to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

and going to the limit at $\alpha \to 0$:

$$\langle f'(x), h \rangle \le 0$$

Also from Cauchy–Bunyakovsky–Schwarz inequality:

$$|\langle f'(x), h \rangle| \le ||f'(x)||_2 ||h||_2$$

 $\langle f'(x), h \rangle \ge -||f'(x)||_2 ||h||_2 = -||f'(x)||_2$

Thus, the direction of the antigradient

$$h = -\frac{f'(x)}{\|f'(x)\|_2}$$

gives the direction of the **steepest local** decreasing of the function f.

Let's consider a linear approximation of the differentiable function f along some direction h, $||h||_2 = 1$:

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want \boldsymbol{h} to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

and going to the limit at $\alpha \to 0$:

$$\langle f'(x), h \rangle \le 0$$

Also from Cauchy–Bunyakovsky–Schwarz inequality:

$$|\langle f'(x), h \rangle| \le ||f'(x)||_2 ||h||_2$$

 $\langle f'(x), h \rangle \ge -||f'(x)||_2 ||h||_2 = -||f'(x)||_2$

Thus, the direction of the antigradient

$$h = -\frac{f'(x)}{\|f'(x)\|_2}$$

gives the direction of the **steepest local** decreasing of the function f. The result of this method is

$$x_{k+1} = x_k - \alpha f'(x_k)$$

Let's consider the following ODE, which is referred to as the Gradient Flow equation.

$$\frac{dx}{dt} = -f'(x(t)) \tag{GF}$$

Let's consider the following ODE, which is referred to as the Gradient Flow equation.

$$\frac{dx}{dt} = -f'(x(t)) \tag{GF}$$

and discretize it on a uniform grid with α step:

$$\frac{x_{k+1} - x_k}{\alpha} = -f'(x_k),$$

Let's consider the following ODE, which is referred to as the Gradient Flow equation.

$$\frac{dx}{dt} = -f'(x(t)) \tag{GF}$$

and discretize it on a uniform grid with α step:

$$\frac{x_{k+1} - x_k}{\alpha} = -f'(x_k),$$

where $x_k \equiv x(t_k)$ and $\alpha = t_{k+1} - t_k$ - is the grid step.

From here we get the expression for x_{k+1}

$$x_{k+1} = x_k - \alpha f'(x_k),$$

which is exactly gradient descent.

Polyak-Lojasiewicz condition. Linear convergence of gradient descent without convexity

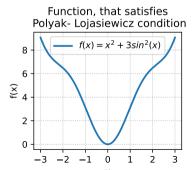

PL inequality holds if the following condition is satisfied for some $\mu > 0$,

$$\|\nabla f(x)\|^2 \ge 2\mu(f(x) - f^*) \quad \forall x$$

It is interesting, that the Gradient Descent algorithm might converge linearly even without convexity.

The following functions satisfy the PL condition but are not convex. **PL**ink to the code

$$f(x) = x^2 + 3\sin^2(x)$$

Polyak-Lojasiewicz condition. Linear convergence of gradient descent without convexity

$$\|\nabla f(x)\|^2 \ge 2\mu(f(x) - f^*) \quad \forall x$$

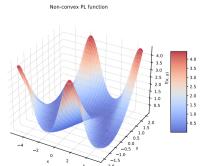

It is interesting, that the Gradient Descent algorithm might converge linearly even without convexity.

The following functions satisfy the PL condition but are not convex. Link to the code

$$f(x) = x^2 + 3\sin^2(x)$$

Function, that satisfies Polyak- Lojasiewicz condition $f(x) = x^2 + 3\sin^2(x)$ 8 6 **∑** 4 2

$$f(x,y) = \frac{(y - \sin x)^2}{2}$$

Theorem

Consider the Problem

$$f(x) \to \min_{x \in \mathbb{R}^d}$$

and assume that f is $\mu\text{-Polyak-Lojasiewicz}$ and L-smooth, for some $L\geq \mu>0.$

Consider $(x^k)_{k\in\mathbb{N}}$ a sequence generated by the gradient descent constant stepsize algorithm, with a stepsize satisfying $0 < \alpha \leq \frac{1}{\tau}$. Then:

$$f(x^k) - f^* \le (1 - \alpha \mu)^k (f(x^0) - f^*).$$

We can use L-smoothness, together with the update rule of the algorithm, to write

$$f(x^{k+1}) \leq f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2$$

 $f \to \min_{x,y,z}$ Polyak-Lojasiewicz smooth case

$$f(x^{k+1}) \le f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2$$
$$= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2$$

$$f(x^{k+1}) \le f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2$$

$$= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2$$

$$= f(x^k) - \frac{\alpha}{2} (2 - L\alpha) \|\nabla f(x^k)\|^2$$

$$f(x^{k+1}) \leq f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2$$

$$= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2$$

$$= f(x^k) - \frac{\alpha}{2} (2 - L\alpha) \|\nabla f(x^k)\|^2$$

$$\leq f(x^k) - \frac{\alpha}{2} \|\nabla f(x^k)\|^2,$$

$$f(x^{k+1}) \leq f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2$$

$$= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2$$

$$= f(x^k) - \frac{\alpha}{2} (2 - L\alpha) \|\nabla f(x^k)\|^2$$

$$\leq f(x^k) - \frac{\alpha}{2} \|\nabla f(x^k)\|^2,$$

We can use L-smoothness, together with the update rule of the algorithm, to write

$$\begin{split} f(x^{k+1}) &\leq f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2 \\ &= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2 \\ &= f(x^k) - \frac{\alpha}{2} \left(2 - L\alpha\right) \|\nabla f(x^k)\|^2 \\ &\leq f(x^k) - \frac{\alpha}{2} \|\nabla f(x^k)\|^2, \end{split}$$

where in the last inequality we used our hypothesis on the stepsize that $\alpha L \leq 1$.

We can use L-smoothness, together with the update rule of the algorithm, to write

$$\begin{split} f(x^{k+1}) &\leq f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2 \\ &= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2 \\ &= f(x^k) - \frac{\alpha}{2} \left(2 - L\alpha\right) \|\nabla f(x^k)\|^2 \\ &\leq f(x^k) - \frac{\alpha}{2} \|\nabla f(x^k)\|^2, \end{split}$$

where in the last inequality we used our hypothesis on the stepsize that $\alpha L \leq 1$.

We can now use the Polyak-Loiasiewicz property to write:

$$f(x^{k+1}) \le f(x^k) - \alpha \mu (f(x^k) - f^*).$$

The conclusion follows after subtracting f^* on both sides of this inequality and using recursion.

Theorem

If a function f(x) is differentiable and μ -strongly convex, then it is a PL function.

Proof

By first order strong convexity criterion:

$$f(y) \ge f(x) + \nabla f(x)^T (y - x) + \frac{\mu}{2} ||y - x||_2^2$$

$$f(x^*) \ge f(x) + \nabla f(x)^T (x^* - x) + \frac{\mu}{2} ||x^* - x||_2^2$$

Theorem

If a function f(x) is differentiable and μ -strongly convex, then it is a PL function.

Proof

By first order strong convexity criterion:

$$f(y) \ge f(x) + \nabla f(x)^T (y - x) + \frac{\mu}{2} ||y - x||_2^2$$

$$f(x^*) \ge f(x) + \nabla f(x)^T (x^* - x) + \frac{\mu}{2} ||x^* - x||_2^2$$

$$f(x) - f(x^*) \le \nabla f(x)^T (x - x^*) - \frac{\mu}{2} ||x^* - x||_2^2 =$$

Theorem

If a function f(x) is differentiable and μ -strongly convex, then it is a PL function.

Proof

By first order strong convexity criterion:

$$f(y) \ge f(x) + \nabla f(x)^T (y - x) + \frac{\mu}{2} ||y - x||_2^2$$

$$f(x^*) \ge f(x) + \nabla f(x)^T (x^* - x) + \frac{\mu}{2} ||x^* - x||_2^2$$

$$f(x) - f(x^*) \le \nabla f(x)^T (x - x^*) - \frac{\mu}{2} ||x^* - x||_2^2 =$$

$$= \left(\nabla f(x)^{T} - \frac{\mu}{2}(x^{*} - x)\right)^{T} (x - x^{*}) =$$

Theorem

If a function f(x) is differentiable and μ -strongly convex, then it is a PL function.

Proof

By first order strong convexity criterion:

$$f(y) \ge f(x) + \nabla f(x)^T (y - x) + \frac{\mu}{2} ||y - x||_2^2$$

$$f(x^*) \ge f(x) + \nabla f(x)^T (x^* - x) + \frac{\mu}{2} ||x^* - x||_2^2$$
$$f(x) - f(x^*) \le \nabla f(x)^T (x - x^*) - \frac{\mu}{2} ||x^* - x||_2^2 =$$

$$|x^* - x||_2^2 =$$

$$= \left(\nabla f(x)^T - \frac{\mu}{2}(x^* - x)\right)^T (x - x^*) =$$

$$= \frac{1}{2} \left(\frac{2}{\sqrt{\mu}} \nabla f(x)^{T} - \sqrt{\mu} (x^{*} - x) \right)^{T} \sqrt{\mu} (x - x^{*}) =$$

Theorem

If a function f(x) is differentiable and μ -strongly convex, then it is a PL function.

Proof

By first order strong convexity criterion:

$$f(y) \ge f(x) + \nabla f(x)^T (y - x) + \frac{\mu}{2} ||y - x||_2^2$$

$$f(x^*) \ge f(x) + \nabla f(x)^T (x^* - x) + \frac{\mu}{2} ||x^* - x||_2^2$$
$$f(x) - f(x^*) \le \nabla f(x)^T (x - x^*) - \frac{\mu}{2} ||x^* - x||_2^2 =$$

$$|x^* - x||_2^2 =$$

$$= \left(\nabla f(x)^T - \frac{\mu}{2}(x^* - x)\right)^T (x - x^*) =$$

$$= \frac{1}{2} \left(\frac{2}{\sqrt{\mu}} \nabla f(x)^{T} - \sqrt{\mu} (x^{*} - x) \right)^{T} \sqrt{\mu} (x - x^{*}) =$$

Theorem

If a function f(x) is differentiable and μ -strongly convex, then it is a PL function.

Proof

By first order strong convexity criterion:

$$f(y) \ge f(x) + \nabla f(x)^T (y - x) + \frac{\mu}{2} ||y - x||_2^2$$

Putting
$$y = x^*$$
:

$$=x$$
:

$$f(x^*) \ge f(x) + \nabla f(x)^T (x^* - x) + \frac{\mu}{2} ||x^* - x||_2^2$$

$$f(x) - f(x^*) \le \nabla f(x)^T (x - x^*) - \frac{\mu}{2} ||x^* - x||_2^2 =$$

$$= \left(\nabla f(x)^{T} - \frac{\mu}{2}(x^{*} - x)\right)^{T} (x - x^{*}) =$$

$$= \frac{1}{2} \left(\frac{2}{\sqrt{\mu}} \nabla f(x)^{T} - \sqrt{\mu} (x^{*} - x) \right)^{T} \sqrt{\mu} (x - x^{*}) =$$

Theorem

If a function f(x) is differentiable and μ -strongly convex, then it is a PL function.

Proof

By first order strong convexity criterion:

$$f(y) \ge f(x) + \nabla f(x)^T (y - x) + \frac{\mu}{2} ||y - x||_2^2$$

Putting $y = x^*$:

$$f(x^*) \ge f(x) + \nabla f(x)^T (x^* - x) + \frac{\mu}{2} ||x^* - x||_2^2$$

$$f(x) - f(x^*) \le \nabla f(x)^T (x - x^*) - \frac{\mu}{2} ||x^* - x||_2^2 =$$

$$-f(x') \le \nabla f(x)' (x-x') - \frac{1}{2} ||x'-x||_2 =$$

$$= \left(\nabla f(x)^T - \frac{\mu}{2} (x^* - x)\right)^T (x - x^*) =$$

$$= \frac{1}{2} \left(\frac{2}{\sqrt{\mu}} \nabla f(x)^{T} - \sqrt{\mu} (x^{*} - x) \right)^{T} \sqrt{\mu} (x - x^{*}) =$$

Let $a=\frac{1}{\sqrt{\mu}}\nabla f(x)$ and $b=\sqrt{\mu}(x-x^*)-\frac{1}{\sqrt{\mu}}\nabla f(x)$

Then
$$a+b=\sqrt{\mu}(x-x^*)$$
 and $a-b=\frac{2}{\sqrt{\mu}}\nabla f(x)-\sqrt{\mu}(x-x^*)$

$$f(x) - f(x^*) \le \frac{1}{2} \left(\frac{1}{\mu} \|\nabla f(x)\|_2^2 - \left\| \sqrt{\mu} (x - x^*) - \frac{1}{\sqrt{\mu}} \nabla f(x) \right\|_2^2 \right)$$

$$f(x) - f(x^*) \le \frac{1}{2} \left(\frac{1}{\mu} \|\nabla f(x)\|_2^2 - \left\| \sqrt{\mu} (x - x^*) - \frac{1}{\sqrt{\mu}} \nabla f(x) \right\|_2^2 \right)$$
$$f(x) - f(x^*) \le \frac{1}{2\mu} \|\nabla f(x)\|_2^2,$$

$$f(x) - f(x^*) \le \frac{1}{2} \left(\frac{1}{\mu} \|\nabla f(x)\|_2^2 - \left\| \sqrt{\mu} (x - x^*) - \frac{1}{\sqrt{\mu}} \nabla f(x) \right\|_2^2 \right)$$
$$f(x) - f(x^*) \le \frac{1}{2\mu} \|\nabla f(x)\|_2^2,$$

$$f(x) - f(x^*) \le \frac{1}{2} \left(\frac{1}{\mu} \|\nabla f(x)\|_2^2 - \left\| \sqrt{\mu} (x - x^*) - \frac{1}{\sqrt{\mu}} \nabla f(x) \right\|_2^2 \right)$$
$$f(x) - f(x^*) \le \frac{1}{2\mu} \|\nabla f(x)\|_2^2,$$

which is exactly the PL condition. It means, that we already have linear convergence proof for any strongly convex function.

Smooth convex case

Theorem

Consider the Problem

$$f(x) \to \min_{x \in \mathbb{R}^d}$$

and assume that f is convex and L-smooth, for some L > 0.

Let $(x^k)_{k\in\mathbb{N}}$ be the sequence of iterates generated by the gradient descent constant stepsize algorithm, with a stepsize satisfying $0<\alpha\leq \frac{1}{L}$. Then, for all $x^*\in \operatorname{argmin} f$, for all $k\in\mathbb{N}$ we have that

$$f(x^k) - f^* \le \frac{\|x^0 - x^*\|^2}{2\alpha k}.$$

• As it was before, we first use smoothness:

$$f(x^{k+1}) \leq f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2$$

$$= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2$$

$$= f(x^k) - \frac{\alpha}{2} (2 - L\alpha) \|\nabla f(x^k)\|^2$$

$$\leq f(x^k) - \frac{\alpha}{2} \|\nabla f(x^k)\|^2,$$

$$f(x^k) - f(x^{k+1}) \geq \frac{1}{2L} \|\nabla f(x^k)\|^2 \text{ if } \alpha \leq \frac{1}{L}$$

$$(1)$$

Typically, for the convergent gradient descent algorithm the higher the learning rate the faster the convergence.

That is why we often will use $\alpha = \frac{1}{4}$.

• As it was before, we first use smoothness:

$$f(x^{k+1}) \leq f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2$$

$$= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2$$

$$= f(x^k) - \frac{\alpha}{2} (2 - L\alpha) \|\nabla f(x^k)\|^2$$

$$\leq f(x^k) - \frac{\alpha}{2} \|\nabla f(x^k)\|^2,$$

$$f(x^k) - f(x^{k+1}) \geq \frac{1}{2L} \|\nabla f(x^k)\|^2 \text{ if } \alpha \leq \frac{1}{L}$$

$$(1)$$

Typically, for the convergent gradient descent algorithm the higher the learning rate the faster the convergence.

That is why we often will use $\alpha = \frac{1}{L}$.

• After that we add convexity:

(2)

• As it was before, we first use smoothness:

$$f(x^{k+1}) \leq f(x^k) + \langle \nabla f(x^k), x^{k+1} - x^k \rangle + \frac{L}{2} \|x^{k+1} - x^k\|^2$$

$$= f(x^k) - \alpha \|\nabla f(x^k)\|^2 + \frac{L\alpha^2}{2} \|\nabla f(x^k)\|^2$$

$$= f(x^k) - \frac{\alpha}{2} (2 - L\alpha) \|\nabla f(x^k)\|^2$$

$$\leq f(x^k) - \frac{\alpha}{2} \|\nabla f(x^k)\|^2,$$
(1)

$$f(x^k) - f(x^{k+1}) \ge \frac{1}{2L} \|\nabla f(x^k)\|^2 \text{ if } \alpha \le \frac{1}{L}$$

Typically, for the convergent gradient descent algorithm the higher the learning rate the faster the convergence. That is why we often will use $\alpha = \frac{1}{4}$.

After that we add convexity:

$$f(y) \ge f(x) + \langle \nabla f(x), y - x \rangle$$

(2)

• As it was before, we first use smoothness:

$$f(x^{k+1}) \leq f(x^{k}) + \langle \nabla f(x^{k}), x^{k+1} - x^{k} \rangle + \frac{L}{2} \|x^{k+1} - x^{k}\|^{2}$$

$$= f(x^{k}) - \alpha \|\nabla f(x^{k})\|^{2} + \frac{L\alpha^{2}}{2} \|\nabla f(x^{k})\|^{2}$$

$$= f(x^{k}) - \frac{\alpha}{2} (2 - L\alpha) \|\nabla f(x^{k})\|^{2}$$

$$\leq f(x^{k}) - \frac{\alpha}{2} \|\nabla f(x^{k})\|^{2},$$
(1)

$$f(x^k) - f(x^{k+1}) \ge \frac{1}{2L} \|\nabla f(x^k)\|^2 \text{ if } \alpha \le \frac{1}{L}$$

Typically, for the convergent gradient descent algorithm the higher the learning rate the faster the convergence. That is why we often will use $\alpha = \frac{1}{T}$.

• After that we add convexity:

$$f(y) \ge f(x) + \langle \nabla f(x), y - x \rangle$$
 with $y = x^*, x = x^k$

 $f \to \min_{x,y,z}$

Lower bounds

Smooth convex case

Theorem

There exists a function f that is L-smooth and convex such that any method 4 satisfies

$$\min_{i \in [1,k]} f(x^i) - f^* \ge \frac{3L||x^0 - x^*||_2^2}{32(1+k)^2}$$

Smooth convex case

Theorem

There exists a function f that is L-smooth and convex such that any method 4 satisfies

$$\min_{i \in [1,k]} f(x^i) - f^* \ge \frac{3L||x^0 - x^*||_2^2}{32(1+k)^2}$$

• No matter what gradient method you provide, there is always a function f that, when you apply your gradient method on minimizing such f, the convergence rate is lower bounded as $\mathcal{O}\left(\frac{1}{k^2}\right)$.

Smooth convex case

Theorem

There exists a function f that is L-smooth and convex such that any method 4 satisfies

$$\min_{i \in [1,k]} f(x^i) - f^* \ge \frac{3L||x^0 - x^*||_2^2}{32(1+k)^2}$$

- No matter what gradient method you provide, there is always a function f that, when you apply your gradient method on minimizing such f, the convergence rate is lower bounded as $\mathcal{O}\left(\frac{1}{k^2}\right)$.
- The key to the proof is to explicitly build a special function f.

• Let d = 2k + 1 and $A \in \mathbb{R}^{d \times d}$.

$$\begin{bmatrix} 2 & -1 & 0 & 0 & \cdots & 0 \\ -1 & 2 & -1 & 0 & \cdots & 0 \\ 0 & -1 & 2 & -1 & \cdots & 0 \\ 0 & 0 & -1 & 2 & \cdots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & \cdots & 2 \end{bmatrix}$$

Lower bounds

• Let d = 2k + 1 and $A \in \mathbb{R}^{d \times d}$.

$$\begin{bmatrix} 2 & -1 & 0 & 0 & \cdots & 0 \\ -1 & 2 & -1 & 0 & \cdots & 0 \\ 0 & -1 & 2 & -1 & \cdots & 0 \\ 0 & 0 & -1 & 2 & \cdots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & \cdots & 2 \end{bmatrix}$$

Notice, that

$$x^{T}Ax = x[1]^{2} + x[d]^{2} + \sum_{i=1}^{d-1} (x[i] - x[i+1])^{2},$$

and, from this expression, it's simple to check $0 \prec A \prec 4I$.

• Let d = 2k + 1 and $A \in \mathbb{R}^{d \times d}$.

Notice, that

$$x^{T}Ax = x[1]^{2} + x[d]^{2} + \sum_{i=1}^{d-1} (x[i] - x[i+1])^{2},$$

and, from this expression, it's simple to check $0 \prec A \prec 4I.$

• Define the following *L*-smooth convex function

$$f(x) = \frac{L}{8}x^{T}Ax - \frac{L}{4}\langle x, e_1 \rangle.$$

• Let d = 2k + 1 and $A \in \mathbb{R}^{d \times d}$.

$$\begin{bmatrix} 2 & -1 & 0 & 0 & \cdots & 0 \\ -1 & 2 & -1 & 0 & \cdots & 0 \\ 0 & -1 & 2 & -1 & \cdots & 0 \\ 0 & 0 & -1 & 2 & \cdots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & \cdots & 2 \end{bmatrix}$$

Notice, that

$$x^{T}Ax = x[1]^{2} + x[d]^{2} + \sum_{i=1}^{d-1} (x[i] - x[i+1])^{2},$$

and, from this expression, it's simple to check $0 \prec A \prec 4I.$

Define the following L-smooth convex function

$$f(x) = \frac{L}{8}x^{T}Ax - \frac{L}{4}\langle x, e_1 \rangle.$$

• The optimal solution x^* satisfies $Ax^*=e_1$, and solving this system of equations gives

$$x^*[i] = 1 - \frac{i}{d+1},$$

• Let d = 2k + 1 and $A \in \mathbb{R}^{d \times d}$.

$$\begin{bmatrix} 2 & -1 & 0 & 0 & \cdots & 0 \\ -1 & 2 & -1 & 0 & \cdots & 0 \\ 0 & -1 & 2 & -1 & \cdots & 0 \\ 0 & 0 & -1 & 2 & \cdots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & \cdots & 2 \end{bmatrix}$$

Notice, that

$$x^{T}Ax = x[1]^{2} + x[d]^{2} + \sum_{i=1}^{d-1} (x[i] - x[i+1])^{2},$$

and, from this expression, it's simple to check $0 \prec A \prec 4I$.

• Define the following *L*-smooth convex function

$$f(x) = \frac{L}{8}x^{T}Ax - \frac{L}{4}\langle x, e_1 \rangle.$$

• The optimal solution x^* satisfies $Ax^* = e_1$, and solving this system of equations gives

$$x^*[i] = 1 - \frac{i}{d+1},$$

And the objective value is

$$f(x^*) = \frac{L}{8} x^{*T} A x^* - \frac{L}{4} \langle x^*, e_1 \rangle$$

= $-\frac{L}{8} \langle x^*, e_1 \rangle = -\frac{L}{8} \left(1 - \frac{1}{d+1} \right).$
