## **Optimality Conditions.** Important notions recap

$$f(x) \to \min_{x \in S}$$

A set S is usually called a budget set.

- A point  $x^*$  is a global minimizer if  $f(x^*) \leq f(x)$  for all x.
- A point  $x^*$  is a local minimizer if there exists a neighborhood N of  $x^*$  such that  $f(x^*) \leq f(x)$  for all  $x \in N$ .
- ullet A point  $x^*$  is a strict local minimizer (also called a strong local minimizer) if there exists a neighborhood N of  $x^*$  such that  $f(x^*) < f(x)$  for all  $x \in N$  with  $x \neq x^*$ .
- We call  $x^*$  a stationary point (or critical) if  $\nabla f(x^*) = 0$ . Any local minimizer must be a stationary point.

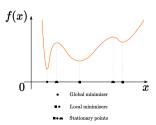

Figure 1: Illustration of different stationary (critical) points

# **Unconstrained optimization recap**

First-Order Necessary Conditions

If  $x^{st}$  is a local minimizer and f is continuously differentiable in an open neighborhood, then

$$\nabla f(x^*) = 0$$

Second-Order Sufficient Conditions

Suppose that  $abla^2 f$  is continuous in an open neighborhood of  $x^*$  and that

$$\nabla f(x^*) = 0 \quad \nabla^2 f(x^*) \succ 0.$$

Then  $x^*$  is a strict local minimizer of f.

# Optimization with equality conditions

Consider simple yet practical case of equality constraints:

$$f(x) o \min_{x \in \mathbb{R}^n}$$
 s.t.  $h_i(x) = 0, i = 1, \dots, p$ 

## Lagrange multipliers recap

The basic idea of Lagrange method implies the switch from conditional to unconditional optimization through increasing the dimensionality of the problem:

$$L(x, \nu) = f(x) + \sum_{i=1}^{p} \nu_i h_i(x) = f(x) + \nu^T h(x) \to \min_{x \in \mathbb{R}^n, \nu \in \mathbb{R}^p}$$

# Lagrange multipliers recap

The basic idea of Lagrange method implies the switch from conditional to unconditional optimization through increasing the dimensionality of the problem:

$$L(x, \nu) = f(x) + \sum_{i=1}^{p} \nu_i h_i(x) = f(x) + \nu^T h(x) \to \min_{x \in \mathbb{R}^n, \nu \in \mathbb{R}^p}$$

#### Necessery conditions:

$$\nabla_x L(x^*, \nu^*) = 0$$

$$\nabla_{\nu} L(x^*, \nu^*) = 0$$

Sufficient conditions: 
$$\langle y,\nabla^2_{xx}L(x^*,\nu^*)y\rangle>0,$$
 
$$\forall y\neq 0\in\mathbb{R}^n:\nabla h_i(x^*)^Ty=0$$

$$\forall y \neq 0 \in \mathbb{R}^n : \nabla h_i(x^*)^T y = 0$$

# Optimization with inequality conditions

Consider simple yet practical case of inequality constraints:

$$f(x) \to \min_{x \in \mathbb{R}^n}$$

$$\text{s.t. } g(x) \leq 0$$

# **Optimization with inequality conditions**

Consider simple yet practical case of inequality constraints:

$$f(x) \to \min_{x \in \mathbb{R}^n}$$
 s.t.  $g(x) \le 0$ 

$$g(x) \leq 0$$
 is inactive.  $g(x^*) < 0$ : 
$$g(x^*) < 0$$

$$\nabla f(x^*) = 0$$

$$\nabla^2 f(x^*) > 0$$

$$g(x) \leq 0$$
 is active.   
 
$$g(x^*) = 0$$
 
$$-\nabla f(x^*) = \lambda \nabla g(x^*), \lambda > 0$$

$$\langle y, \nabla^2_{xx} L(x^*, \lambda^*) y \rangle > 0,$$

$$\langle y, \nabla^2_{xx} L(x^*, \lambda^*) y \rangle > 0,$$
  
 $\forall y \neq 0 \in \mathbb{R}^n : \nabla g(x^*)^\top y = 0$ 

## **General formulation**

General problem of mathematical programming:

$$f_0(x) 
ightarrow \min_{x \in \mathbb{R}^n}$$
 s.t.  $f_i(x) \leq 0, \ i=1,\ldots,m$   $h_i(x) = 0, \ i=1,\ldots,p$ 

#### **General formulation**

General problem of mathematical programming:

$$f_0(x) o \min_{x \in \mathbb{R}^n}$$
  
s.t.  $f_i(x) \leq 0, \ i=1,\ldots,m$   
 $h_i(x) = 0, \ i=1,\ldots,p$ 

The solution involves constructing a Lagrange function:

$$L(x,\lambda,\nu) = f_0(x) + \sum_{i=1}^m \lambda_i f_i(x) + \sum_{i=1}^p \nu_i h_i(x)$$

## **KKT Necessary conditions**

Let  $x^*$ ,  $(\lambda^*, \nu^*)$  be a solution to a mathematical programming problem with zero duality gap (the optimal value for the primal problem  $p^*$  is equal to the optimal value for the dual problem  $d^*$ ). Let also the functions  $f_0, f_i, h_i$  be differentiable.

Karush-Kuhn-Tucker conditions

# **KKT Necessary conditions**

Let  $x^*$ ,  $(\lambda^*, \nu^*)$  be a solution to a mathematical programming problem with zero duality gap (the optimal value for the primal problem  $p^*$  is equal to the optimal value for the dual problem  $d^*$ ). Let also the functions  $f_0, f_i, h_i$  be differentiable.

$$(1)\nabla_x L(x^*, \lambda^*, \nu^*) = 0$$

$$(2)\nabla_\nu L(x^*, \lambda^*, \nu^*) = 0$$

$$(3)\lambda_i^* \ge 0, i = 1, \dots, m$$

$$(4)\lambda_i^* f_i(x^*) = 0, i = 1, \dots, m$$

$$(5) f_i(x^*) \le 0, i = 1, \dots, m$$

# **KKT Some regularity conditions**

These conditions are needed in order to make KKT solutions the necessary conditions. Some of them even turn necessary conditions into sufficient. For example, Slater's condition:

∌ ດ **ຍ** 

# KKT Some regularity conditions

These conditions are needed in order to make KKT solutions the necessary conditions. Some of them even turn necessary conditions into sufficient. For example, Slater's condition:

If for a convex problem (i.e., assuming minimization,  $f_0, f_i$  are convex and  $h_i$  are affine), there exists a point x such that h(x)=0 and  $f_i(x)<0$  (existance of a strictly feasible point), then we have a zero duality gap and KKT conditions become necessary and sufficient.

#### KKT Sufficient conditions

For smooth, non-linear optimization problems, a second order sufficient condition is given as follows. The solution  $x^*, \lambda^*, \nu^*$ , which satisfies the KKT conditions (above) is a constrained local minimum if for the Lagrangian,

$$L(x, \lambda, \nu) = f_0(x) + \sum_{i=1}^{m} \lambda_i f_i(x) + \sum_{i=1}^{p} \nu_i h_i(x)$$

the following conditions hold:

$$\langle y, \nabla_{xx}^2 L(x^*, \lambda^*, \nu^*) y \rangle > 0$$
  
 $\forall y \neq 0 \in \mathbb{R}^n : \nabla h_i(x^*)^\top y = 0, \nabla f_0(x^*)^\top y \leq 0, \nabla f_j(x^*)^\top y = 0$   
 $i = 1, \dots, p \quad \forall j : f_j(x^*) = 0$ 

## Question

Function  $f:E\to\mathbb{R}$  is defined as

$$f(x) = \ln\left(-Q(x)\right)$$

where  $E = \{x \in \mathbb{R}^n : Q(x) < 0\}$  and

$$Q(x) = \frac{1}{2}x^{\mathsf{T}}Ax + b^{\mathsf{T}}x + c$$

with  $A \in \mathbb{S}_{++}^n$ ,  $b \in \mathbb{R}^n$ ,  $c \in \mathbb{R}$ .

Find the maximizer  $x^*$  of the function f.

#### Question

Give an explicit solution of the following task.

$$f(x,y) = x + y \to \min$$
 s.t.  $x^2 + y^2 = 1$ 

where  $x, y \in \mathbb{R}$ .

#### Question

Give an explicit solution of the following task.

$$\langle c, x \rangle + \sum_{i=1}^{n} x_i \log x_i \to \min_{x \in \mathbb{R}^n}$$

$$\text{s.t. } \sum_{i=1}^n x_i = 1,$$

where  $x \in \mathbb{R}^n_{++}, c \neq 0$ .

## Question

Give an explicit solution of the following task.

$$f(x,y) = (x-2)^2 + 2(y-1)^2 \to \min$$

$$\mathsf{s.t.}\ x + 4y \leq 3$$

$$x + 4y \le 3$$
$$x \ge y$$

where  $x, y \in \mathbb{R}$ .

#### Question

Given  $y \in \{-1, 1\}$ , and  $X \in \mathbb{R}^{n \times p}$ , the Support Vector Machine problem is:

$$\frac{1}{2}||w||_2^2 + C\sum_{i=1}^n \xi_i \to \min_{w, w_0, \xi_i}$$

s.t. 
$$\xi_i > 0, i = 1, \dots, n$$

$$y_i(x_i^T w + w_0) > 1 - \xi_i, i = 1, \dots, n$$

find the KKT stationarity condition.
